

ABSTRACT

Methods for the diagnosis of visceral, cutaneous and canine leishmaniasis in a subject suspected of being infected with the parasitic protozoa *Leishmania* is disclosed. Disclosed are antibody-capture enzyme-linked immunosorbent assays (ELISAs) for the detection of antibodies to *Leishmania* parasite soluble antigens and antigen-capture ELISAs for the detection of *Leishmania* parasite soluble antigens in host samples. Also disclosed are immunodiagnostic kits for the detection of *Leishmania* parasite circulating antigens or IgM and IgG antibodies in a sample from subject having visceral, cutaneous or canine leishmaniasis. In these methods and kits, detection may be done photometrically or visually. The methods and kits also allow the visualization of *Leishmania* amastigotes or promastigotes in a sample.
